

Figure 1: Data flow

1 The fig2vect program

The `fig2vect` program processes Fig files (“*.fig”) produced by graphics applications, i.e. XFig, jFig or WinFig. Possible output formats are MetaPost, EPS and SVG. The MetaPost files (“*.mp”) can be used as input for the MetaPost program (“mp” or “mpost”) to produce “*.mps” files.

The “*.mps” files can be referenced by \LaTeX sources, these sources can be processed using either \LaTeX or `pdf \LaTeX` .

The “*.eps” files can be referenced by \LaTeX sources too. You need the “epstopdf” package to run `pdf \LaTeX` on these sources.

The “*.svg” files can be used in HTML files on Web sites.
